

enSights Disaster Recovery Test Summary

Document	Disaster Recovery Test Summary
Organization	enSights
Scope	enSights production SaaS platform
Reporting period	Calendar year 2026 to date
Issued	October 2026
Classification	Confidential

1. Executive summary

enSights maintains a documented disaster recovery (DR) plan for the loss of its primary hosting region. During the reporting period enSights carried out two planned DR exercises covering data restoration and a full rebuild of the production infrastructure in a secondary region. Findings from the exercises were recorded and the DR playbook was updated as a result.

2. DR program overview

- **Strategy:** backup and restore into a secondary AWS region in Europe.
- **Infrastructure:** the production AWS infrastructure is defined as code and can be rebuilt in the secondary region from version-controlled configuration.
- **Data protection:** backups of the main operational database and the workflow database are copied automatically to the secondary region, and the main operational database supports point-in-time recovery. The analytics database is backed up automatically by its managed service provider.
- **Immutable backups:** a monthly backup copy is stored under a write-once lock in compliance mode. It cannot be deleted or altered for 365 days, including by administrators.
- **Secrets:** application secrets are replicated to the secondary region.
- **Governance:** the plan names decision authority for declaring a disaster, a communication tree, and a customer notification process.
- **Testing cadence:** the DR plan calls for a full exercise annually, and defines monthly backup and replication health checks.

3. Test scope and methodology

Exercise	Date	Type	Objective	Method
DR-01	May 2026	Data restore test	Prove that production	Restored the main operational

Exercise	Date	Type	Objective	Method
			databases can be recovered from backup	database from backup into a separate cluster in the secondary region, and the analytics database from backup into a separate service.
DR-02	June 2026	Infrastructure recovery test	Prove that the production platform can be rebuilt in the secondary region	Rebuilt networking, compute cluster, and supporting services in the secondary region from code, then deployed an application service onto it through the standard deployment pipeline. Production data was intentionally not connected during this exercise.

Restored data was loaded into separate environments, not into production.

4. Results

Exercise	Status	Summary
DR-01	Completed	Both databases were restored from backup into separate environments. The analytics database restore completed in about 20 minutes.
DR-02	Completed	The production infrastructure was rebuilt in the secondary region from code, and an application service was deployed on it.

5. Findings and improvements

Each exercise produced procedural findings, such as restore-specific configuration steps and measured recovery durations. These were logged in the internal DR log with owners, closed, and incorporated into the DR playbook. No finding remains open from these exercises.

6. Approval

Role	Name	Date
Prepared by	Nadav Shohat, DevOps	2026-10-01
Approved by	Dekel Yaacov, CTO	2026-10-01
